

Refresh a SOAP Web Service

To change the services consumed from a SOAP Web Service or to modify the list of consumed methods, refresh the service in Service Studio:

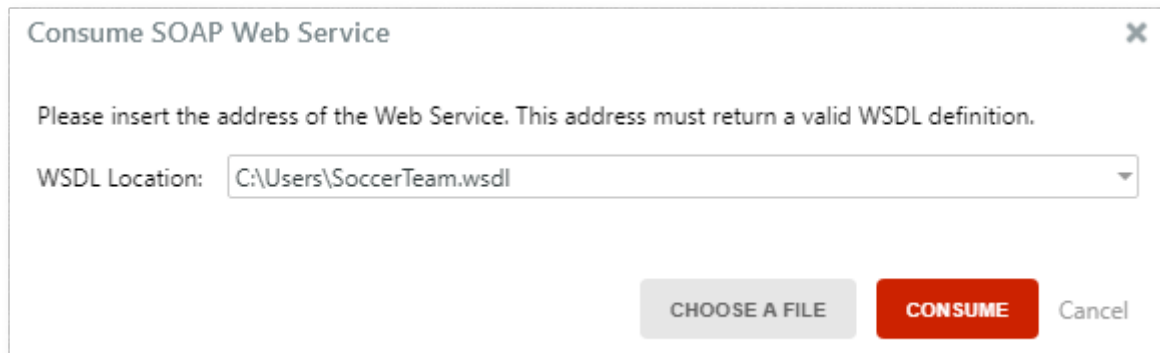

1. In the **Logic** tab, open the **Integrations** folder.
2. Under **Integrations** > **SOAP**, right-click the SOAP Web Service you want to refresh and select **Refresh SOAP Web Service**. In this example, the Web Service name is **SoccerTeam**.

3. In the Refresh SOAP Web Service popup, click **Yes**.

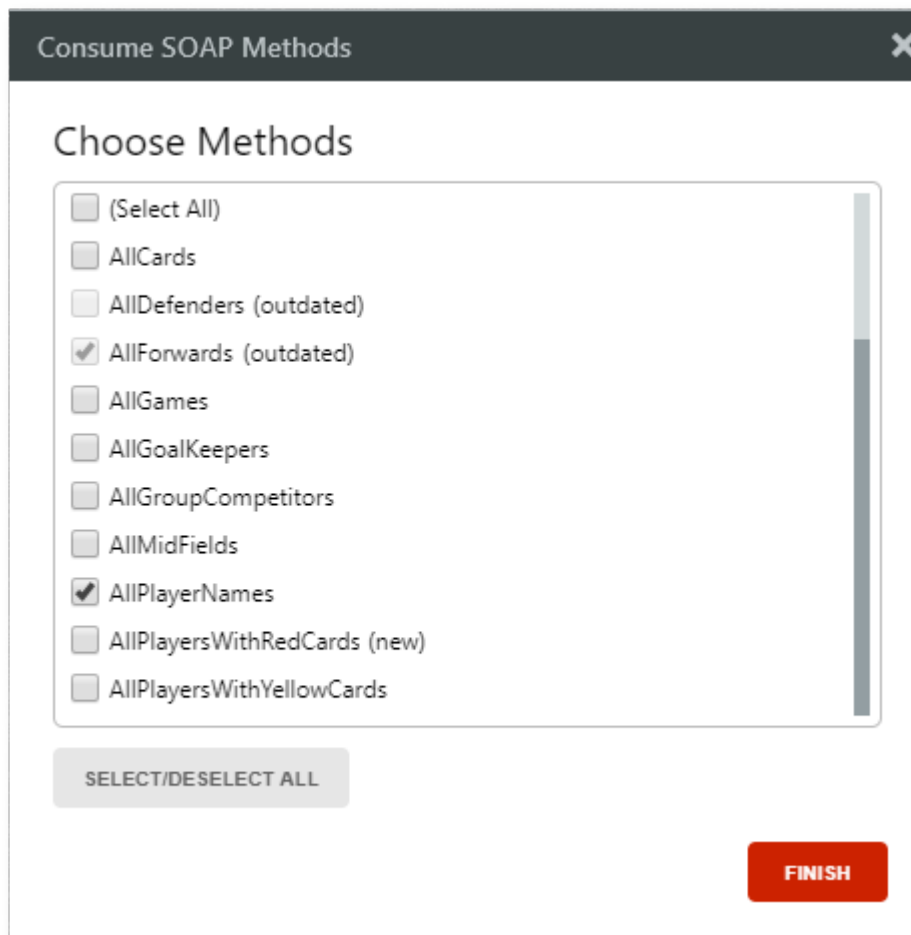

4. If changed, type the URL or local file path for the WSDL, and then click **Consume**. Service Studio subsequently re-reads the WSDL and displays a selectable list of available methods to consume.

5. Select all methods you want to consume. Note that:

- Methods you select or exclude overwrite all previously consumed methods
- Methods no longer in the WSDL have an "(outdated)" label; these will no longer exist in the service
- New methods include a "(new)" label

6. Click **Finish** to consume the selected methods. In this example, only the AllPlayersNames method is consumed.
